DBMS Assignment

Ans-1) Database security issues refer to problems, risks or challenges that threaten the confidentiality, integrity, & availability of data stored in a database system. These issues arise due to legal regulations, organizational policies or technical weaknesses in the system.

1) Legal & ethical issues ⇒

- organizations store sensitive data such as personal details, financial information & medical records.
- employees must maintain confidentiality & responsible data usage.

2) Policy issues ⇒

- security policies define who can access, modify & delete data.
- weak policies can lead to unauthorized access & misuse of information.

3) System-related issues ⇒

- Poor system configuration can allow hackers to exploit vulnerabilities.
- weak authentication, outdated software or lack of encryption can compromise database security.

Ans-2) Database security control techniques

1) Access control $\Rightarrow$

- It ensures that users can access only the data they are permitted to view or modify.
- Implemented users authentication, passwords & role based permissions.

2) Inference control $\Rightarrow$

- Sometimes uses combine different pieces of data to infer sensitive info.
- Inference control techniques limit or modify query results to prevent such deductions.

3) Flow control

- ensures that info. moves only according to predefined security rules.
- Prevents sensitive data from flowing from high-security levels to lower security levels.

4) Data encryption $\Rightarrow$

- only users with the correct decryption key can read the data.
- Protects data during storage & transmission.

Ans - 3) CREATE VIEW Employee - view AS
SELECT EmpID, EmpName, DeptName
FROM Employee;

Explanation ⇒

CREATE VIEW Employee - view ⇒ creates a virtual
table named employee - view.

SELECT EmpID, EmpName, DeptID ⇒ selects only these
3 columns

FROM employee ⇒ data is taken from the
employee table.
